Neurogenic inflammation " Statins. symptomatic treatment of vasomotor rhinitis including rhinorrhea, nasal congestion, and post nasal drip in adults and children 12 years of age and older

The history of nasal surgery can be separated into three periods. The first was when nasal operations only consisted of the repair of minimal external nose injuries. The second period was characterised by the need for restoring amputated noses in several countries. The third period marks the current era of nasal surgery development. The first period of nasal surgery was dated back to 1500 B.C. There were no attempts to treat nasal damage, leading to complete loss of the nose. Nose amputation served as penalisation for war criminals and women deemed indecent, resulting... == History == The exact cause is unclear. They may be related to chronic inflammation of the lining of the sinuses. They occur more commonly among people who have allergies, cystic fibrosis, aspirin sensitivity, or certain infections. The polyp itself represents an overgrowth of the mucous membranes. It may be diagnosed by looking up the nose. A CT scan may be used to determine the number of polyps and help plan surgery.

Benzalkonium chloride in nasal sprays and drug-induced rhinitis, others have recommended that benzalkonium chloride in nasal sprays be avoided. In the United States, nasal steroid

Nasal surgery Furthermore, nasal surgery is also conducted for cosmetic purposes. Nasal surgery is a medical procedure designed to treat various conditions that cause nasal blockages in the upper respiratory tract, for example nasal polyps, inferior turbinate hypertrophy, and chronic rhinosinusitis. It encompasses several types of techniques, including rhinoplasty, septoplasty, sinus surgery, and turbinoplasty, each with its respective postoperative treatments. While there are potential risks and

complications associated, the advancement of medical instruments and enhanced surgical skills have helped mitigate them

Treatment is typically with steroids, often in the form of a nasal spray. If this is not effective, surgery may be considered. The condition often recurs following surgery; thus, continued use of a steroid nasal spray is often recommended. Antihistamines may help with symptoms but do not change the underlying disease. Antibiotics are not required for treatment unless an infection...
