The epidermis is the most superficial layer of skin, a squamous epithelium with several strata: the
stratum corneum, stratum lucidum, stratum granulosum, stratum spinosum, and stratum basale.
Nourishment is provided to these layers by diffusion from the dermis... 76919f6beb 16α-LE2

List of skin conditions The skin weighs an average of four kilograms, covers an area of two square metres, and is made of three distinct layers: the epidermis, dermis, and subcutaneous tissue. In the embryo, the epidermis, hair, and glands form from the ectoderm, which is chemically influenced by the underlying mesoderm that forms the dermis and subcutaneous tissues. Within the latter type, the hairs occur in structures called pilosebaceous units, each with hair follicle, sebaceous gland, and associated arrector pili muscle. dermatitis Breast eczema (nipple eczema) Chronic vesiculobullous hand eczema Circumostomy eczema Dyshidrosis (acute vesiculobullous hand eczema, cheiropompholyx Many skin conditions affect the human integumentary system—the organ system covering the entire surface of the body and composed of skin, hair, nails, and related muscles and glands. The two main types of human skin are: glabrous skin, the hairless skin on the palms and soles (also referred to as the

"palmoplantar" surfaces), and hair-bearing skin. The major function of this system is as a barrier against the external environment 76919f6beb
