

Does Stress Delay Menstruation

Although amenorrhea has... ff9e8e7346 == Pathophysiology == ff9e8e7346 In 2017, National Institutes of Health researchers discovered that women with... ff9e8e7346

Amenorrhea Amenorrhea is a symptom with many potential causes. who has reached reproductive age and who is not on birth control does not menstruate. Primary amenorrhea Amenorrhea or amenorrhoea is the absence of a menstrual period in a female organism which has reached reproductive age. In humans, it is where a woman or girl who has reached reproductive age and who is not on birth control does not menstruate. Physiological states of amenorrhea are most commonly seen during pregnancy and lactation (breastfeeding) ff9e8e7346

Delayed puberty especially in women where onset of menstruation correlated well between mothers and daughters and between sisters. Pubertal delay can be separated into four categories Delayed puberty is when a person lacks or has incomplete development of specific sexual characteristics past the usual age of onset of puberty. The term sexual infantilism has also been used medically as a synonym for delayed puberty. The person may have no physical or hormonal signs that puberty has begun ff9e8e7346

Declarative learning The capital of a state is a declarative piece of information, while knowing how to ride a bike is not. during the study that were menstruating and exposed to the TSST task showed lower levels of stress than women not menstruating, they also had an increase Declarative learning is acquiring information that one can speak about (contrast with motor learning). Episodic memory and semantic memory are a further division of declarative information ff9e8e7346

Initial workup for delayed puberty not due to a chronic condition involves measuring serum FSH, LH, testosterone/estradiol, as well as bone age radiography. If it becomes clear that... ff9e8e7346 There is a later age of onset in Asian populations compared to the West, but it too is changing with time... ff9e8e7346

Menstruation Menstruation is triggered by falling progesterone levels, and is a sign that pregnancy has not occurred. Feminine hygiene products are used in order to maintain hygiene during menses. The menstrual cycle is characterized by the rise and fall of hormones. during cycle day 20 has been found to effectively delay menstruation for at least 20 days, with menstruation starting after 2-3 days have passed since discontinuing Menstruation (also known as a period, among other colloquial terms) is the regular discharge of blood and mucosal tissue from the inner lining of the uterus through the vagina ff9e8e7346

A presumed diagnosis can be made based on symptoms and medical imaging; laparoscopy... ff9e8e7346 PMDD's exact cause is unknown. Ovarian hormone levels during the menstrual cycle do not differ between those with PMDD and the general population. But because symptoms are present only during ovulatory cycles and resolve after menstruation, it is believed to be caused by fluctuations in gonadal sex hormones or variations in sensitivity to sex hormones. ff9e8e7346 Research indicates declarative and habit memory compete with each other during distraction. When in doubt, the brain chooses habit memory because it is automatic. ff9e8e7346

Functional hypothalamic amenorrhea psychologist to provide psychological support is recommended. If menstruation does not resume spontaneously following lifestyle changes, the patient Functional hypothalamic amenorrhea (FHA) is a form of amenorrhea and chronic anovulation and is one of the most common types of secondary amenorrhea. It is classified as hypogonadotropic hypogonadism ff9e8e7346

The timing of menarche is influenced by female biology, as well as genetic, environmental factors, and nutritional factors. The mean age of menarche has declined over the last century, but the magnitude of the decline and the factors responsible remain subjects of contention. The worldwide average age of menarche is very difficult to estimate accurately, and it varies significantly by geographical region, race, ethnicity and other characteristics, and occurs mostly during a span of ages from 8 to 16, with a small percentage of girls having menarche by age 10, and the vast majority having it by the time they were 14. ff9e8e7346 Most commonly, puberty may be delayed for several years and still occur normally, in which case it is considered constitutional delay of growth and puberty, a common variation of healthy physical development. Delay of puberty may also occur due to various causes such as malnutrition, various systemic diseases, or defects of the reproductive system (hypogonadism) or the body's responsiveness to sex hormones. ff9e8e7346 == Overview == ff9e8e7346

Premenstrual dysphoric disorder The most intense symptoms occur Premenstrual dysphoric disorder (PMDD) is a mood disorder characterized by emotional, cognitive, and physical symptoms. PMDD has a profound impact on an individual's quality of life and dramatically increases the risk of suicidal ideation and even suicide attempts. Symptoms typically improve within a few days after the onset of menses, and are minimal or absent in the week after menses. PMDD can cause significant distress and impairment during the luteal phase of the menstrual cycle (between ovulation and menstruation). begin and worsen until the onset of menstruation, with many not feeling relief until a few days after menstruation ends. Within this group, some will meet the criteria for PMDD. Many women experience discomfort or mild mood changes before menstruation, but 5-8% experience severe premenstrual syndrome (PMS), causing significant distress or functional impairment ff9e8e7346

In the United States, girls are considered to have delayed puberty if they lack breast development by age 13 or have not started menstruating by age 15. Boys are considered to have delayed puberty if they lack

enlargement of the testicles by age 14. Delayed puberty affects about 2% of adolescents. ff9e8e7346 Formerly known as the female athlete triad, RED-S is a syndrome of three interrelated conditions. Thus, if an athlete is suffering from one element of the triad, it is likely that they are suffering from the other two components of the triad as well... ff9e8e7346 Declarative memory uses your medial temporal lobe and enables you to recall the telephone number at will. Procedural memory activates the telephone number only when you are at the telephone, and uses your right-hemisphere's skill, pattern recognition. ff9e8e7346 It was previously known as "juvenile hypothalamosis syndrome," prior to the discovery that sexually mature females are equally affected. FHA has multiple risk factors, including stress-related, weight-related, and exercise-related factors. FHA is caused by stress-induced suppression of the hypothalamic-pituitary-ovarian (HPO) axis, which results in inhibition of gonadotropin-releasing hormone (GnRH) secretion, and gonadotropins, follicle-stimulating hormone (FSH), and luteinizing hormone (LH). ff9e8e7346 RED-S is the broader, more comprehensive name for what was formerly known as the female athlete triad (or simply the triad), which was a condition seen in females participating in sports that emphasize leanness or low body weight. As the non-menstrual components are also seen in males, the name was changed to the comprehensive term RED-S. ff9e8e7346 A menstrual taboo is any social taboo concerned with menstruation. In some societies it involves menstruation being perceived as unclean or embarrassing, inhibiting even the mention of menstruation whether in public (in the media and advertising) or in private (among friends, in the household, or with men). Many traditional religions consider menstruation ritually unclean, although anthropologists say that the concepts 'sacred' and 'unclean' may be intimately connected. ff9e8e7346

Culture and menstruation The basis of many conduct norms and communication about menstruation in western There are many cultural aspects surrounding how societies view menstruation. By contrast, in some indigenous hunter-gatherer societies, menstrual observances are viewed in a positive light, without any connotation of uncleanness. view menstruation. Different cultures view menstruation in different ways. The basis of many conduct norms and communication about menstruation in western industrial societies is the belief that menstruation should remain hidden. In most of India, menarche is celebrated as a rite of passage. Different cultures view menstruation in different ways ff9e8e7346

The terms menstruation and menses are derived from the Latin: mensis, lit. 'month', which in turn is cognate with the Ancient Greek: μήνη, romanized: mēnē, lit. 'lunar month', and the roots of the English... ff9e8e7346 "Functional" is used to indicate a behavioral... ff9e8e7346 == Classification == ff9e8e7346 There are two ways to learn a telephone number: memorize it using your declarative memory, or use it many times to create a habit. Habit learning is called procedural memory. ff9e8e7346 Several researchers at the UCLA tested the hypothesis that distraction can change the way a task is learned. In their experiment, they played a series of high and low tones while asking subjects to do a simple probabilistic classification task. In the single task (ST) case, subjects only learned to... ff9e8e7346 The first period, a point in time known as menarche, usually begins during puberty, between the ages of 11 and 13. However, menstruation starting as young as eight years would still be considered normal. The average age of the first period is generally later in the developing world, and earlier in the developed world. The typical length of time between the first day of one period and the first day of the next is 21 to 45 days in young women; in adults, the range is between 21 and 35 days with the average often cited as 28 days. In the largest study of menstrual app data, the mean menstrual cycle length was determined to be 29.3 days. Bleeding typically lasts two to seven days. Periods stop during pregnancy and typically do not resume during the initial months... ff9e8e7346 == Mythology == ff9e8e7346 Symptoms vary widely between individuals. Some have no symptoms, while for others it is a debilitating disease. Common symptoms include pelvic pain, heavy and painful periods, pain with bowel movements, painful urination, painful sex, fatigue, and infertility. Beyond bodily symptoms, endometriosis can affect a person's mental health and social life. It is not known exactly what causes the disease. Possible causes include backward (retrograde) flow of menstrual fluid, genetic factors, hormones, and problems with the immune system. ff9e8e7346 Severe and potentially prolonged hypoestrogenism is perhaps the most dangerous hormonal pathology associated with the disease, because consequences of this disturbance can influence bone health, cardiovascular health, mental health, and metabolic functioning in both the short and long-term. Because many of the symptoms overlap with those of organic hypothalamic, pituitary, or gonadal disease and therefore must be ruled out, FHA is a diagnosis of exclusion. ff9e8e7346

Endometriosis Symptoms typically begin in adolescence or the early 20s, and tend to improve after menopause as estrogen levels go down. The tissue most often grows close to the uterus, such as on the ovaries, fallopian tubes, or the lining of the pelvis. endometrium renew the tissue after menstruation. It can also appear on the bowel, bladder, and in some cases on the lungs or skin. In women with endometriosis, more tissue is shed from this layer during menstruation, allowing more stem cells Endometriosis is a disease in which tissue similar to the endometrium—the lining of the uterus (womb)—grows elsewhere in the body. Worldwide, endometriosis affects approximately 10% of the female population of reproductive age, representing nearly 200 million women ff9e8e7346

Relative energy deficiency in sport RED-S is a serious illness with lifelong health consequences and can potentially be fatal. It is caused by eating too little food to support the amount of energy being expended by an athlete, often at the urging of a coach or other authority figure who believes that athletes are more likely to win competitions when they have an extremely lean body type. and behavior is likely to mask the food deficiency and delay appropriate treatment. A menstruating person taking contraceptives to treat menstrual dysfunction Relative energy deficiency in sport (RED-S) is a syndrome in which disordered eating (or low energy availability), amenorrhoea/oligomenorrhoea (in women), and decreased bone mineral density (osteoporosis and osteopenia) are present ff9e8e7346

Menarche From both social and medical perspectives, it is often considered the central event of female puberty, as it signals the possibility of fertility. society and sent to menstruation huts during menarche and every menstruation following as the blood associated with menstruation in the Beta Israel Jewish Menarche (mǝ-NAR-kee; from Ancient Greek μήν (mēn) 'month' and ἀρχή (arkhē) 'beginning') is the first menstrual cycle, or first menstrual bleeding, in female humans. Having menarche occur between the ages of 9–14 in the West is considered normal. Girls experience menarche at different ages, but the most common age is 12 ff9e8e7346

Amenorrhea is a symptom with many potential causes. Primary amenorrhea is defined as an absence of secondary sexual characteristics by age 13 with no menarche or normal secondary sexual characteristics but no menarche by 15 years of age. It may be caused by developmental problems, such as the congenital absence of the uterus, failure of the ovary to receive or maintain egg cells, or delay in pubertal development. Secondary amenorrhea, ceasing of menstrual cycles after menarche, is defined as the absence of menses for three months in a woman with previously normal menstruation, or six months for women with a history

of oligomenorrhea. It is often caused by hormonal disturbances from the hypothalamus and the pituitary gland, premature menopause, intrauterine scar formation, or eating disorders. ff9e8e7346
