Antibiotic use in livestock that antibiotics were first used in farming towards the end of the war, in the form of intra-mammary penicillin preparations to treat bovine mastitis. However, used irresponsibly, this may lead to antibiotic resistance which may impact human, animal and environmental health. Antibiotics are an important tool to treat animal as well as human disease, safeguard animal health and welfare, and support food safety. At The use of antibiotics in the husbandry of livestock includes treatment when ill (therapeutic), treatment of a group of animals when at least one is diagnosed with clinical infection (metaphylaxis), and preventative treatment (prophylaxis)
