Mitotic cell rounding The phenomenon is seen both in artificial cultures in vitro and naturally forming tissue in vivo. Cells abandon the spread or elongated shape characteristic of interphase and contract into a spherical morphology during mitosis. Lancaster, Oscar M; La Berre, Mael; Dimitracopoulos, Andrea; Bonazzi, Daria; Zlotek-Zlotkiewicz, Ewa; Picone, Remigio; Duke, Thomas; Piel, Matthieu; Baum Mitotic cell rounding is a shape change that occurs in most animal cells that undergo mitosis b8eaaa91df

History of the nude in art Amura World. Retrieved 4 November 2024. "Debajo de la piel" (in Spanish). November 2024. Nudity in art has generally reflected the social standards for aesthetics and morality of the era in which the work was made. Mackenzie, Suzie. Many cultures tolerate nudity in art to a greater extent than nudity in real life, with different parameters for what is

acceptable: for example, even in a museum where nude works are displayed, nudity of the visitor is generally not acceptable. As a genre, the nude is a complex subject to approach because of its many variants, both formal, aesthetic, and iconographic, and some art historians consider it the most important subject in the history of Western art. Retrieved 20 August The historical evolution of the nude in art runs parallel to the history of art in general, except for small particularities derived from the different acceptance of nudity by the various societies and cultures that have succeeded each other in the world over time. It is considered one of the academic classifications of works of art. The nude is an artistic genre that consists of the representation in various artistic media (painting, sculpture, or, more recently, film and photography) of the naked human body. == WikiProject Norway == b8eaaa91df 48 articles are listed for this project. b8eaaa91df The development of vitiligo is linked to aberrant attachments between melanocytes (which produce melanin) and laminins, an extracellular protein. The disorder is thought to be caused by immune system changes with potential genetic factors. Often first appearing by young adulthood, it may be triggered by environmental factors, sun or chemical exposure, stress, and physical trauma. The most common form

tends to affect more skin over time, with potential treatments including topical medications and light therapy. b8eaaa91df

Vitiligo Retrieved 7 October 2024. Retrieved 12 December 2022 Vitiligo (VIT-ih-LY-goh) is a chronic autoimmune disorder that causes skin to lose pigment (specifically melanin, which gives the skin color) in patches that vary in size and can appear anywhere on the body. "Taliana Vargas muestra nuevas marcas de vitiligo en su piel". 4 June 2021. El Tiempo (in Spanish) b8eaaa91df

== Early observations == b8eaaa91df In antiquity, the disorder was often conflated with leprosy, an infectious disease. Some public figures have had vitiligo, such as the singer Michael Jackson, who obscured his condition until it affected his entire

body. b8eaaa91df

Skin immunity 52 (5): 211-24. Hence the skin provides defense in depth against infection. "La función inmunológica de la piel". Dermatología Rev Mex. In addition to providing a passive physical barrier against infection, the skin also contains elements of the innate and adaptive immune systems which allows it to actively fight infections. Alejandro Palma Ramos; Carmen Padilla Desgarenes (2008). Grice EA, Segre JA Skin immunity is a property of skin that allows it to resist infections from pathogens b8eaaa91df

6 articles are listed for this project. b8eaaa91df The only sign of vitiligo is the presence of pale, patchy areas of depigmented skin, which tend to occur on the extremities. Some people may experience itching before a new patch appears. The patches are initially small, but often... b8eaaa91df

In 1935, one of the first published accounts of mitotic rounding in live tissue described cell rounding in the pseudostratified epithelium of the

mammalian neural tube. Sauer noticed that cells in mitosis rounded up to the apical, or luminal, surface of the columnar epithelium before dividing and returning to their elongated morphology.

The process of mitosis is divided into stages corresponding to the completion of one set of activities and the start of the next. These stages are preprophase (specific to plant cells), prophase, prometaphase, metaphase, anaphase, and telophase. During mitosis, the chromosomes, which have already duplicated... b8eaaa91df
The skin acts as a barrier, a kind of sheath, made of several layers of cells and their related glands. The skin is a dynamic organ that contains different cells which contains elements of the innate and the adaptive immune systems which are activated when the tissue is under attack by invading pathogens. Shortly after infection, the immune adaptive response is induced by dendritic cells (Langerhans cells) present in the epidermis; they are responsible for the capture,

processing, and presentation of antigens to T lymphocytes in local lymphoid organs. As a result, T lymphocytes express the cutaneous lymphocyte antigen (CLA) molecule, a modified form of P-selectin glycoprotein ligand-1. Lymphocytes move to the epidermis where they reside as memory T cells, they will thus be activated and will trigger an inflammatory response. Dysregulation of these mechanisms... b8eaaa91df

Mitosis Cadart C, Zlotek-Zlotkiewicz E, Le Berre M, Piel M, Matthews HK (April 2014). Mitosis is preceded by the S phase of interphase (during which DNA replication occurs) and is followed by telophase and cytokinesis, which divide the cytoplasm, organelles, and cell membrane of one cell into two new cells containing roughly equal shares of these cellular components. Cell division by mitosis is an equational division which gives rise to genetically

identical cells in which the total number of chromosomes is maintained. This process ensures that each daughter cell receives an identical set of chromosomes, maintaining genetic stability across cell generations. 1038/nature12335. "Exploring the function of cell shape and size Mitosis () is a part of the cell cycle in eukaryotic cells in which replicated chromosomes are separated into two new nuclei. The different stages of mitosis altogether define the mitotic phase (M phase) of a cell cycle—the division of the mother cell into two daughter cells genetically identical to each other.
